Prof. Dr. Sonja Utz  
Everyday Media Lab  
Leibniz-Institut für Wissensmedien (IWM)  
Schleichstraße 6, 72076 Tübingen

24 September 2026

### Application: Researcher / PhD position, Everyday Media Lab, Ref. 1014-2026

Dear Professor Utz,

The AI system I built showed its average accuracy rising from 64.7 to 85.8 per cent over five versions, and I believed it. I would like to spend a doctorate in your lab studying that belief in people who did not build the system. I hold an MSc in Data Analytics from the University of Portsmouth, awarded with Distinction in December 2025 (credit-weighted average 70.5, dissertation mark 78), which I took as a Chevening Scholar (2024/25).

ArtemisAI is where I learned to distrust my own numbers. I founded it in 2025 as a social media analytics company; it is running in production ahead of our December launch and has processed over three million comments. Claude labels about 6,000 posts and DeepSeek about 12,000 more, both through their APIs, and six fine-tuned encoder classifiers learn from those labels. The dashboard number looked authoritative because it was precise, it came from a system I understood, and it went up. When I audited it, the first three versions had been scored against 97 human-labelled posts and the last two against Claude's labels, so part of the rise was agreement with another model, not with people. On toxicity the two labelling tiers agreed on 0.0 per cent of labels, because they used different taxonomies, while the model reported 96.7 per cent average confidence, a figure with no human criterion behind it. What I had read as accuracy was agreement, not validity. What stayed with me was not the error but my own judgement: I had built the system, and I still found its output credible on cues that told me nothing about whether it was correct.

The doubt began at Dubizzle Labs, where I led a team collecting text in English, Arabic, Urdu and Hindi across 15 countries and saw that people write differently on forums and on social platforms: forum users qualify at length, while platforms compress. My MSc dissertation took that observation to data: an ethics-approved, GDPR-compliant quantitative study of public reaction to UK economic policy, with about 279,000 posts from X, Reddit, YouTube and Quora, a fine-tuned BERT classifier tested against BiLSTM and lexicon baselines, and a 200-post human-coded validation set (inter-annotator Cohen's kappa about 0.78). The same policy news looked visibly different on each platform, which I could describe but not yet test. Psychometrics had names and tools for what I had been circling. With my supervisor, Dr Ella Haig, I wrote a methods manuscript that treats each platform as a survey mode and sets out a protocol adapting measurement invariance, differential item functioning and score linking to machine-labelled sentiment; in a 500-replication simulation, a naively pooled index gave the wrong sign on nearly a quarter of days. Writing it up, I found my own headline macro-F1 of 0.878 had been scored against lexicon-seeded labels rather than the human coders, and the manuscript says so.

Since December 2024 I have worked as a data engineer at M+C Saatchi Fluency, on social data for clients including UK Government departments. Part of the role is checking what a number means before anyone acts on it. In one recent project I analysed a year of consumer social conversation: topic modelling to find candidate themes, a codebook applied by an LLM that I checked by hand on a pilot sample and revised until its systematic errors were fixed or handled by explicit rules, and separate reporting for audiences that should not be pooled.

Anderl et al. (2024) found that the same information was judged more credible when a conversational agent presented it than as static encyclopedia text, and that readers were worse at spotting its inaccuracies. My dashboard was a workplace version: a presentation cue carrying credibility the content had not earned. Utz, Goyanes and Gil de Zúñiga (2026) describe a cue route to trust in AI news through the AI heuristic, alongside an action route through seeing AI as a social entity. Observers read a precise figure as a sign that the speaker is confident (Jerez-Fernandez, Angulo and Oppenheimer, 2014), and I would test whether a precise figure or a stated confidence acts as such a cue for AI output; communicative AI at work produces both routinely.

My question is whether numeric precision and stated confidence in LLM answers and summaries raise credibility independently of accuracy and make errors harder to detect. I expect both. I would extend the accurate versus partially inaccurate paradigm of Anderl et al. (2024) to knowledge workers and to errors that real systems make, measuring error detection and retention rather than trust alone. I can build those stimuli: LLM summaries of real social media discussion, coded against human judgement, so every statement has a known accuracy. Natural errors may be harder to spot than

planted ones, which bears on how far laboratory estimates generalise. Study 1 would be a preregistered online experiment crossing how confidence is stated (verbally or as a precise figure, at matched levels, against a no-confidence control) with whether the content is accurate, measuring credibility judgements and error detection. Study 2 would test incidental learning: participants meet the same summaries in a simulated professional feed, and an unannounced later test asks what they believe people said, including the wrong figures, and whether precision made those stick. Anderl, Gaiser and Utz (2026) found informational benefits of work-related social media use in the moment but no meaningful lagged effects; Study 2 asks what persists when the information comes from an AI. I would reshape the design with you.

The gaps are these. My master's is in data analytics rather than psychology or communication science. My empirical work is quantitative but observational: I have not yet run an experiment with human participants, so I would draft and preregister Study 1 in my first months, within the lab's practice. I have no publications; the manuscript with Dr Haig is complete but not yet submitted. I do not speak German yet and would begin learning it on arrival.

I would accept the 75 per cent contract, relocate to Tübingen and agree a start date with you. If my profile fits the agentic science position (1013-2026) better, I would be glad to be considered for it too. I have spent seven years building the systems that turn what people say online into numbers, and the last two finding out how far one of those numbers travels before anyone asks what it was measured against. I would like to spend the next three on a question where the answer reaches people rather than dashboards, and would welcome the chance to discuss it with you. My CV, certificates and transcripts follow; my portfolio is at [asad-ikram-mc.github.io/portfolio](https://asad-ikram-mc.github.io/portfolio).

Yours sincerely,

**Asad Ikram**

## PROFILE

I turn what people write on social media into numbers, and I test whether those numbers mean what they claim. For seven years I built the systems that collect and code public posts; for the last two I have been checking what they produce: validating automated coding against human coders, separating agreement between models from validity, and asking whether a score means the same thing on every platform. My Master's project was a designed, ethics-approved quantitative study of public text.

Research interests      Credibility judgments of AI-generated information, especially when a precise confidence figure has no relation to correctness; incidental learning and informational benefits from social media and communicative AI at work; validity of automated text coding across platforms, models and time.

## ANALYSIS METHODS

|                   |                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content analysis  | Automated content analysis validated against human coding; codebook design, piloting and revision; sentiment, emotion (including the NRC lexicon), toxicity, topic and intent coding; topic modelling to find candidate themes; LLM-assisted annotation checked by hand. Classifiers are fine-tuned encoder models (BERT, XLM-R, DistilBERT, DeBERTa-v3). |
| Statistics        | Inter-coder reliability (Cohen's $\kappa$ ); agreement versus criterion validity; McNemar tests, bootstrap confidence intervals, chi-square tests; probability calibration; simulation with known ground truth; checks of coverage, denominators and whether groups can be pooled.                                                                        |
| Measurement       | Generalizability theory, measurement invariance, differential item functioning and score linking, specified in a protocol and tested by simulation; not yet fitted to collected data.                                                                                                                                                                     |
| Research practice | Ethics approval and GDPR-compliant handling of public text; analysis anchors fixed in advance, before any counts were computed; documented, reproducible analysis pipelines.                                                                                                                                                                              |
| Software          | Python, PyTorch, SQL, PySpark; R (working knowledge). Data access through official APIs and licensed feeds (Meta Graph, Reddit, YouTube, Brandwatch, Sprinklr); AWS, Airflow, Docker.                                                                                                                                                                     |

## EDUCATION

|                                 |                                                                                                                                                                                                                                                                                                                                                                                          |

**Ikram, A. and Haig, E.** "Is the Platform Part of the Measurement? A Protocol and Simulation Study for Cross-Platform Equivalence of Machine-Labelled Policy Sentiment." Complete; not published and not submitted.

- Treats each social platform as a survey mode and asks whether a classifier measures the same construct on each: a generalizability study against a human criterion, invariance and differential item functioning with platform as the grouping facet, and score linking. Fifteen anchor events fixed on 21 August 2026, before any window count was computed.
- 500-replication simulation with known ground truth: an index that pools platform scores at face value misstates a known event shift by roughly an eighth and reports the wrong sign of aggregate sentiment on nearly a quarter of days; the measurement-adjusted index gets the sign right on all but about one day in sixty.

No peer-reviewed publications to date.

| Feb 2025 - present  | <p><b>Founder and Chief Technology Officer</b>, ArtemisAI Ltd (trading as ViralData), United Kingdom (remote). Social media analytics, running in production ahead of launch on 8 December 2026.</p> <ul style="list-style-type: none"><li>• <b>Text classification.</b> The pipeline processes 111,000+ posts and 3.39 million comments from 30+ public pages. Six fine-tuned encoder classifiers code sentiment, emotion, toxicity, topic, language and intent.</li><li>• <b>Annotation design.</b> Claude labels about 6,000 posts with its reasoning; rules mined from that reasoning prompt DeepSeek, which labels about 12,000 more; cases below 0.80 confidence return to Claude.</li><li>• <b>Evaluation design.</b> Release gate specified as macro-F1 above 0.85 on both a 97-post human holdout and a 4,000-item stratified test set, followed by a human check of 200 random posts; weekly monitoring of shifts in output distributions.</li><li>• <b>Agreement is not validity.</b> The two labelling tiers agree on 82.9% of sentiment, 74.4% of emotion and 0.0% of toxicity labels (a taxonomy mismatch), while the toxicity model reports 96.7% average confidence: a precise, confident number with no criterion behind it.</li><li>• <b>A moving reference.</b> Reported average accuracy rose from 64.7 (v1) to 85.8 (v5), but v1 to v3 were scored against the human holdout and v4 onward against Claude's labels, so part of the gain is the reference moving rather than the model improving.</li></ul> |
| Dec 2024 - present  | <p><b>Data Engineer, consultant</b>, M+C Saatchi Fluency, United Kingdom (remote)</p> <ul style="list-style-type: none"><li>• Social data for campaign intelligence for UK Government departments, Amazon, Ford, Nike and Reckitt.</li><li>• <b>Discourse analysis.</b> Analysed consumer social conversation for client teams: topic modelling for candidate themes, an LLM-applied codebook checked by hand on a pilot sample, and audience segments reported separately where pooling would mislead.</li><li>• <b>Checking what is counted.</b> Coverage audits of incoming data before any comparison, re-derivation of reported figures from source, and consistent denominators across reported metrics.</li><li>• Infrastructure: 68 collectors (62 active) ingesting ten platforms daily, 6.7 million items in six weeks; one governed master table with documented filter rules and pre-delete backups.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Feb 2022 - Aug 2024 | <p><b>Senior Data Engineer</b>, Dubizzle Labs (Dubizzle, Bayut, Zameen, OLX), Pakistan</p> <ul style="list-style-type: none"><li>• Multilingual platform data in English, Arabic, Urdu and Hindi from 15 MENA countries. Led three engineers and 500+ collectors; redesigned the warehouse, ETL throughput up 60%. Promoted twice in two years.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2018 - present      | <p><b>Earlier and concurrent engagements</b></p> <ul style="list-style-type: none"><li>• <b>Fix.com</b>, Canada, consultant, part time, May 2023 to present: 50M+ data points from 200+ sources; validation with schema-drift detection cut bad production data by 70%.</li><li>• <b>VendueTech</b>, Ireland, Lead Data Engineer, Jun to Jul 2025: led three engineers, latency cut by 40%. <b>Prefe</b>, Italy, Sep to Dec 2024: failure rate cut by 60%, mentored two juniors. <b>CXG</b>, Dubai, Dec 2025 to Jan 2026.</li><li>• <b>Freelance data engineer</b>, Dec 2018 to Feb 2026: 300+ five-star projects across 400+ websites for 50+ international clients.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

AWARDS, PUBLIC WORK AND LANGUAGES

|              |                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Chevening    | Chevening Scholar 2024/25 (UK FCDO), selected from 70,000+ applicants in 160 countries; funded the MSc.                                        |
| Public work  | Author of web-scraping-guide.com, a free public reference on web data collection, its ethics and data quality.                                 |
| Languages    | Urdu (native). English: MSc taught and assessed in English; IELTS Academic 6.5 (March 2024). No German yet; I would begin learning on arrival. |
| Availability | Can start in November 2026 and relocate to Tübingen.                                                                                           |

UNIVERSITY OF PORTSMOUTH

**Asad Ikram**

*has been awarded the degree of*

**Master of Science in  
Data Analytics**

**with Distinction**

**having followed a programme of study approved by Academic Council**

**08 December 2025**

Professor Graham Galbraith CBE,  
Vice-Chancellor

Rebecca Di Pancrazio,  
Academic Registrar

Student Number: 2291687 | Reference Number: 98611074-01-5ACA

Name of student **Asad Ikram**  
Qualification **Master of Science in Data Analytics**  
Award Classification **Distinction**  
Date of Award **08 December 2025**  
Mode of Study **Full Time**

University reference **2291687**  
Date of birth **20 January 1998**  
HESA reference **24100071550094239**

Awarding Institution **University of Portsmouth**  
Teaching Institution **University of Portsmouth**

## Record of Learning and Achievement

| 2024/2025                | MSC DATA ANALYTICS - FHEQ Level 7            | Mark | Credit     | Decision |
|--------------------------|----------------------------------------------|------|------------|----------|
| M32616                   | Masters Project                              | 78   | 60         | Pass     |
| M33145                   | Programming for Data Analytics and AI        | 56   | 15         | Pass     |
| M33146                   | Big Data and Machine Learning Applications   | 67   | 30         | Pass     |
| M33147                   | Intelligent Data and Text Analytics          | 62   | 30         | Pass     |
| M33148                   | Data Visualisation and Exploratory Analytics | 70   | 15         | Pass     |
| M33149                   | Data Management                              | 80   | 15         | Pass     |
| M33516                   | Explainable AI                               | 70   | 15         | Pass     |
| Credits gained for award |                                              |      | <b>180</b> |          |

# National University of Computer & Emerging Sciences

*This is to certify that*

**Mr. Asad Ikram**

*has been admitted to the degree of*

**Bachelor of Science (Computer Science)**

*With all the honours, privileges, and responsibilities pertaining thereto.*

*Awarded in the city of Islamabad on the Thirty First day of January in the year 2022.*

A stylized, handwritten signature in black ink, consisting of a large, looped 'A' followed by a horizontal line and a small flourish.

*Rector*

A handwritten signature in black ink, reading 'Wasim Sajjad' in a cursive style.

*Chancellor*

Student Name: **Asad Ikram**  
Date of Birth: **January 20, 1998**  
Univ. Reg. No: **17K-3943**

Roll No: **17K-3943**  
Degree: **BS (Computer Science)**

**Fall 2017**

Test Report Form

ACADEMIC

**NOTE** Admission to undergraduate and post graduate courses should be based on the ACADEMIC Reading and Writing Modules. GENERAL TRAINING Reading and Writing Modules are **not** designed to test the full range of language skills required for academic purposes. It is recommended that the candidate's language ability as indicated in this Test Report Form be re-assessed **after two years** from the date of the test. To find out more about IELTS, IELTS band scores and the CEFR levels, please visit [ielts.org/scores](https://ielts.org/scores)
